**Pdf download for mac**

Continue

There are plenty of ways to view and edit PDFs on a Mac, but Apple's built-in Preview application is phenomenal and often overlooked. While Lion didn't wow the crowd with most of its features, it brought some amazing additions to Apple's PDF viewer/editor that puts it over the top and makes it our choice for the best. Note: There are a few ways you could define a PDF viewer/editor, as features can range from simple form-filling to complete PDF manipulation. For this post we're concentrating on the features the average person would use, meaning viewing, form completion, annotation, and so on.UPDATE: Wondershare is claiming we named their Product, PDF Editor, our top choice. We did not, and they are using a false award that claims our approval. Please do not buy their products as they are a dishonest company. We've left the original text (stricken out) about PDF Editor in the alternatives section so you can see how little of a recommendation we made.PreviewPlatform: Mac OS X Price: Free Download PageFeaturesView and edit images in addition to PDF filesAnnotate, highlight, and mark up PDFs in several waysDigitally fill out formsSign PDF documents with your webcam (read on for more info)Super-fast performanceSuper-fast searchInsert new pages into PDFsView and edit PDF metadataAdd and edit hyperlinks in a PDF fileWhere It ExcelsPreview is fast. Mac OS X isn't exactly known for its speed and efficiency, so Preview's ability to blow through PDF documents is pretty impressive. But among its many handy highlighting and annotating features, which are all solid, its ability to fill out forms is especially impressive. This may seem like a mundane thing, but when you get to the signature line it is hard to eschew at least a little reverence. Preview (in Lion) has a feature where you can sign a piece of paper, hold it up to your computer's webcam, and it'll turn it into a high-quality signature you can place in a form. It can also save multiple signatures so you don't have to continuously repeat this process. Preview is solid all-around, but it's those sorts of features that make it amazing.G/O Media may get a commissionWhere It Falls ShortAs incredible as Preview's webcam signature feature is, it seems kind of strange that there is no ability to sign with your trackpad as well. After all, Apple Stores let you sign for purchases with your finger on an iPod touch. Additionally, Preview wasn't exactly perfect prior to Lion and Lion isn't exactly perfect on its own. It's hard to justify upgrading to OS X 10.7 if Preview is the only draw. If you're sticking with Snow Leopard, your version of Preview isn't bad but it's certainly not the best PDF editor/viewer you can find. Apple fixed a lot of quirks in Lion, which make it a pleasure to use, but if you're not running Lion you're pretty much out of luck.The CompetitionPDFPen costs $60 but is pretty great. If you need more features than Preview can provide, it'll get the job done. PDFPen makes page rearrangement, editing, multi-document assembly, and more very easy. While it's on the expensive side, consider it a cheaper alternative to Adobe Acrobat ($200). We've never loved Acrobat and it likely provides more features than you're going to need.Wondershare PDF Editor ($50) is another pricey option, but it has the ability to convert PDFs to Microsoft Word documents. We're not sure how well this works, but you might want to give it a try if that's something you need. Wondershare placed a false claim on their PDF Editor software that we considered it the best. They even created a fake Lifehacker approval image to act as if we provided them with an official award. We listed it as an alternative here, but as Wondershare has opted to falsely market their product with a seal of approval from us that we never provided, we ask that you do not buy from them.Skim is a great choice if your primary focus is annotation as that's what it was design to do. It has an impressively long list of features to make annotation easy.Got any other favorite PDF editor/viewer apps for Mac that you love? Share 'em in the comments.Lifehacker's App Directory is a new and growing directory of recommendations for the best applications and tools in a number of given categories. Creating a PDF file on a Mac is really easy, and you can quickly and easily convert virtually any document to PDF or create one from scratch. For most document sharing, PDF is simply the way to go. Whether or not it is ideal or perfect, it’s clear that PDF has gained nearly universal appeal and as such, it’s one of the best ways to reliably share your documents with others. At this point, any operating system you use should be able to open PDFs. How to Create a PDF from an Existing Document Let’s say that you have a complete document that you want to share with someone as a PDF file. That’s easy: we just need to convert it, which OS X makes very easy. First, open the document in its native app. If you’re working on a Word document, then you’ll do this from Word. Want to PDF-ify a webpage? Then open it up in Safari, and so on. Creating the PDF is accomplished via the print dialog, which can be accessed via the “File” menu or using the keyboard shortcut Command+P. Now, note the “PDF” controls in the lower-left corner of the Print dialog. You will need to click on this menu to access further options. There are a few choices you can explore here, the most obvious being “Save as PDF”. But there are also others to directly create and mail via the Mail app, or send it via Messages. Let’s assume, however, that you just want to save your document as a PDF. That’s pretty simple. Just select “Save as PDF”, give it a name (at the very least), as well as other optional pieces of information such as a subject and any keywords you want to add to make locating the PDF easier later on. The security options are also an important item to note. Using them, you can require a password to open the document, and add further layers of security, including requiring a password to copy text, images, and other content, as well as to print it. You can choose one, the other, or both. How to Create a PDF from Images and Documents in Preview We covered how to convert images to PDF, but say you want to combine a number of documents and/or images into one PDF. To do that, you’ll use Preview. Let’s go ahead and take a text file and convert it from the Print dialog, as shown above. Only this time, we’ll choose “Open PDF in Preview”. It’s important to understand that you can’t edit the newly converted document in Preview–you can only combine existing files. So, you need to make sure you’ve written just how you want it before opening it in Preview. Now, you can go ahead and add other documents or images as new pages. Just drag the next file–in this case, we’ll use an image as page 2–into Preview’s sidebar. The image won’t be added to the existing page, but placed between them. If you’re not content with how your images are arranged, you can drag them around to fit your needs. RELATED: How to Make Mac Finder Tags Work for You So, once you’ve got it all sorted and arranged to your liking, it’s time to save your newly designed PDF, which you can simply do by pressing Command+S on your keyboard, or clicking File > Save in the menu bar. Of course, the best way to share a fully-formed document is to simply print it as PDF, but if you’re simply looking to include inline instructions for images or perhaps provide narration for someone to create a slideshow, then combining text and images into one PDF is a great no-nonsense way to do it. This ensures you don’t run into any annoying compatibility issues. If you want to encrypt a PDF on a Mac, the easiest method is to use the Preview app. You can use Preview to add a password to your most sensitive PDF documents to keep them secure. Preview is available as a core macOS app, so you’ll find it on any Mac computer. There’s no additional software required—all you need is a PDF document to encrypt and a Mac to encrypt it with. If you’d prefer to use other software, you can password-protect PDFs using Microsoft Office instead, but Preview offers the quickest way to do it using a core Mac app. RELATED: How to Password Protect Documents and PDFs with Microsoft Office To add a password to a PDF document on macOS, open the Preview app from the Launchpad, which you can launch from the Dock at the bottom of your Mac’s display. Alternatively, you can launch Preview from the Applications folder in the Finder app—you’ll also find this as an icon on your Dock. Once Preview is open, click File > Open from the menu bar to open the PDF document you want to encrypt with a password. To begin encrypting the PDF document you’ve opened in Preview, click File > Export from the menu bar. This will bring up various options to export your PDF in different formats, including the option to add a password. If you don’t want to overwrite your existing document, you’ll need to give your new document a name in the “Export As” box. Confirm the save location under the “Where” drop-down menu. To add a password, click the “Encrypt” checkbox in the options menu and then type a secure password in the “Password” and “Verify” boxes immediately underneath. RELATED: How to Create a Strong Password (and Remember It) Press the “Save” button to save your encrypted PDF document once you’ve confirmed your settings. Your PDF document will then be exported using the options you’ve selected. Loading the document in Preview after the file has been encrypted will require you to insert a password. Type in the document password in the “Password” box and then press Enter on your keyboard. If the password is correct, this will decrypt the file and open the document. You’ll be able to continue viewing the file until you close it—once closed, you’ll need to re-enter the password to view the file again.
